Install the Google Chrome Web browser, it's required to use this tool.

Once Chrome is installed, Open Chrome and make sure you're logged into your Google account. Once you're logged in you do not need to remain on the page (you can close the tab/window or browse away from it)

1. Go to the Chrome Remote Desktop website in your web browser, either by search or clicking the link below
   a. Link : https://remotedesktop.google.com/
   b. **Open** your **web browser** and go to ***Google.com***, search for : *Chrome Remote Desktop*. Click the sites link which should be at the top :

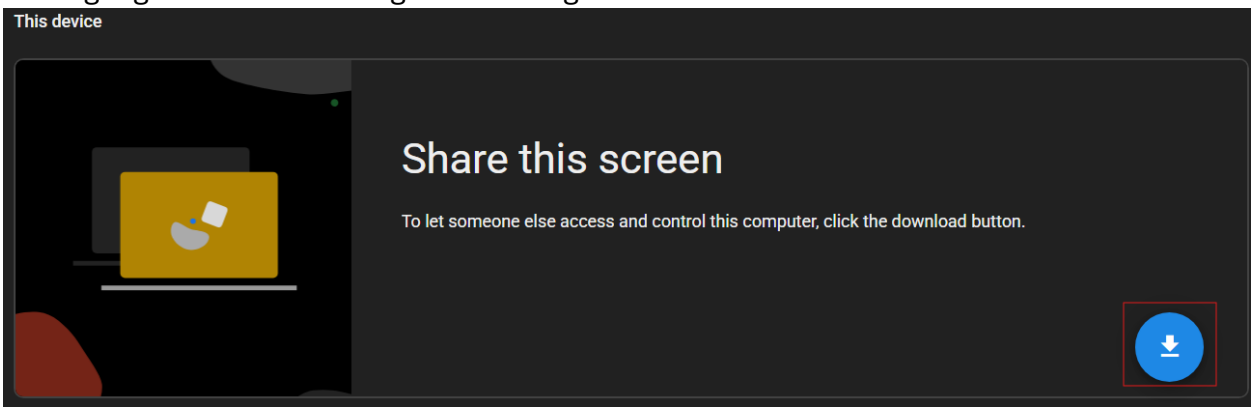

2. **Click** the '**Share my screen'** button, located in two places :
   a. the Top Right corner of the page
   b. the Bottom Right of the page
   It will be located to the right of an '*Access my computer'* button in both places.

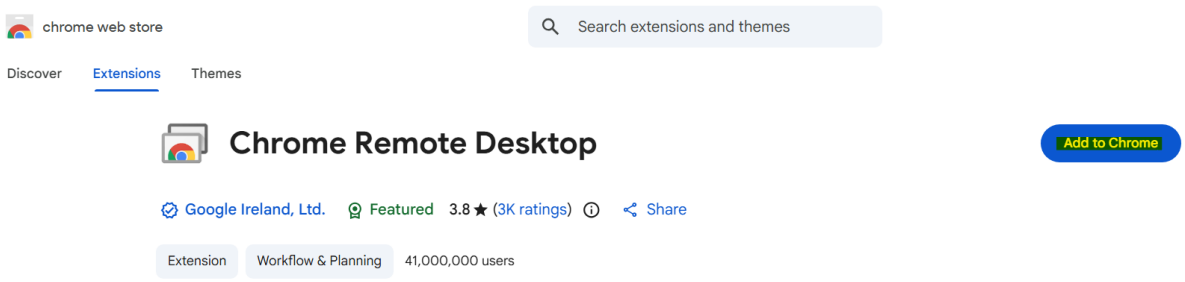

- Log in to your Google account if you haven't already (in the top right corner you'll use a profile picture or the login option)

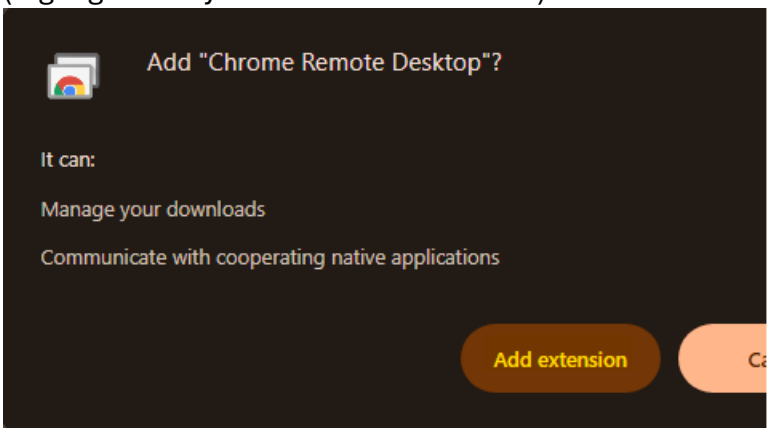

3. Click the circular BLUE download button underneath the Share this screen section. I've highlighted it with a thin green rectangle below.

4. A new page will open, click the blue '**Add to Chrome'** button when it's available (highlighted in yellow in the screenshot below)

5. A permission request window will pop up, click the '**Add extension**' button on it (highlighted in yellow in the screenshot)

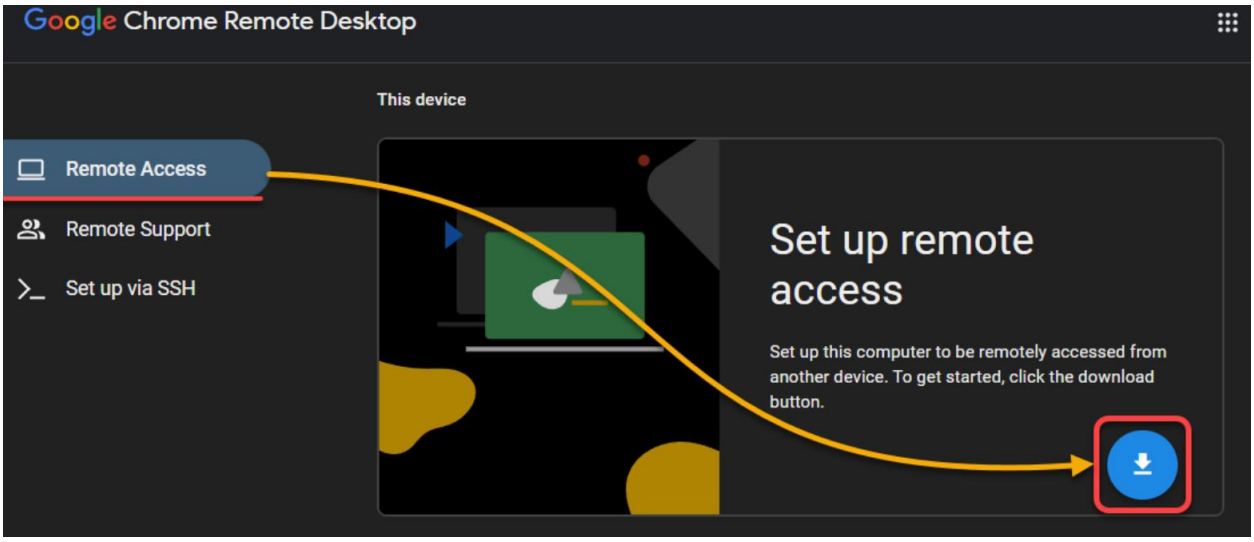

You'll know it's done when the Add to chrome button changes to a Remove from Chrome button

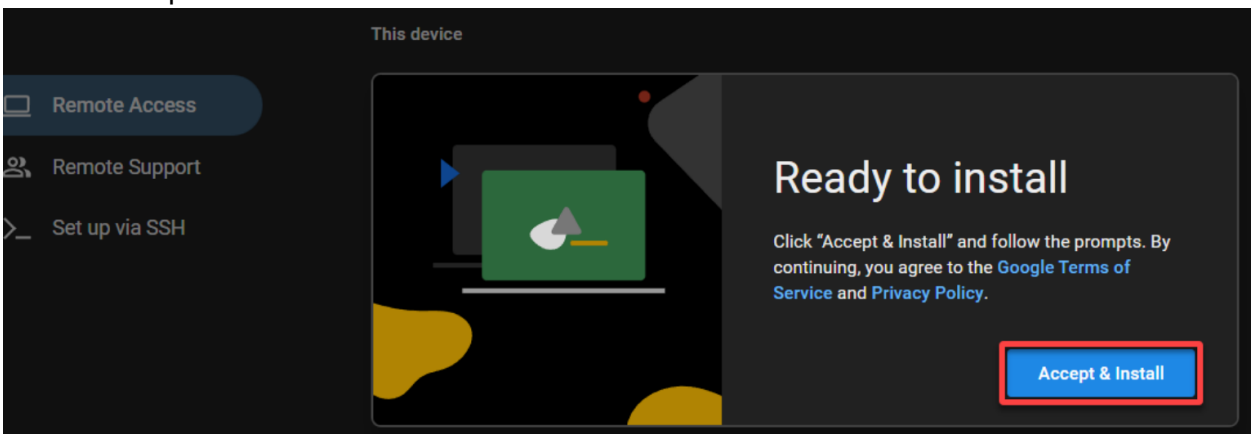

6. Go back to the Chrome Remoe Desktop main screen in the web browser (or just click the link here : https://remotedesktop.google.com/support)

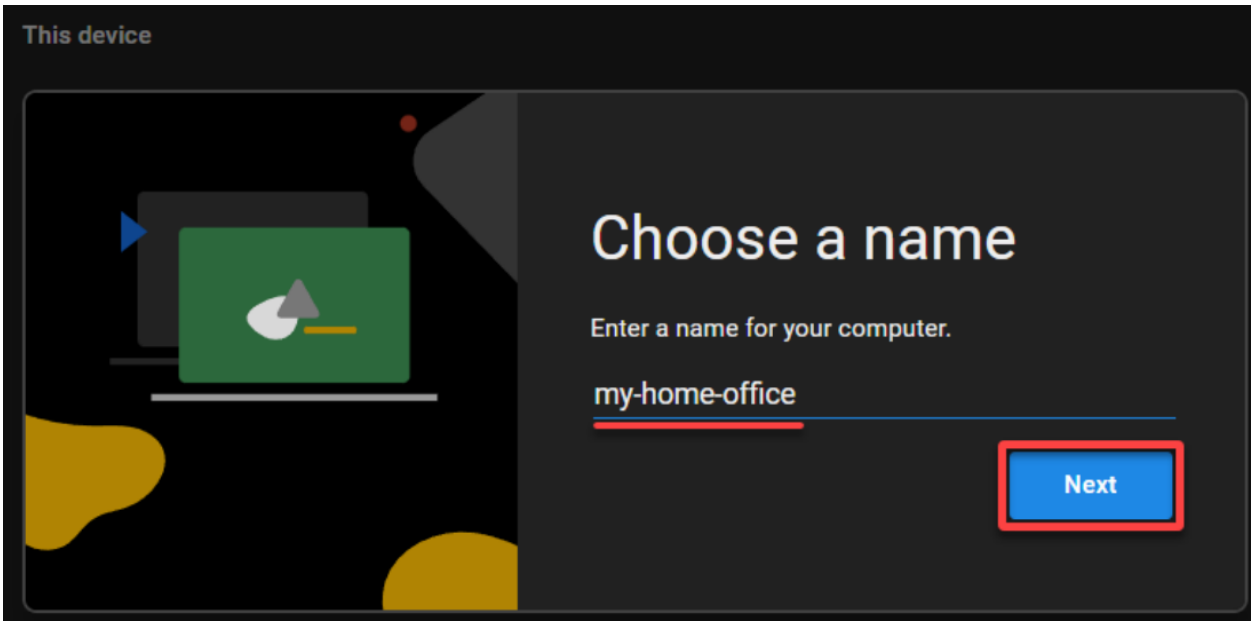

7. Click Remote Access in the menu on the left hand side of the screen. You should see a Setup Remote Access section with another download button, click the Download button again. You may have a pop up asking you to verify downloading and saving, click YES/OK to install ***chromeremotedesktophost.msi***

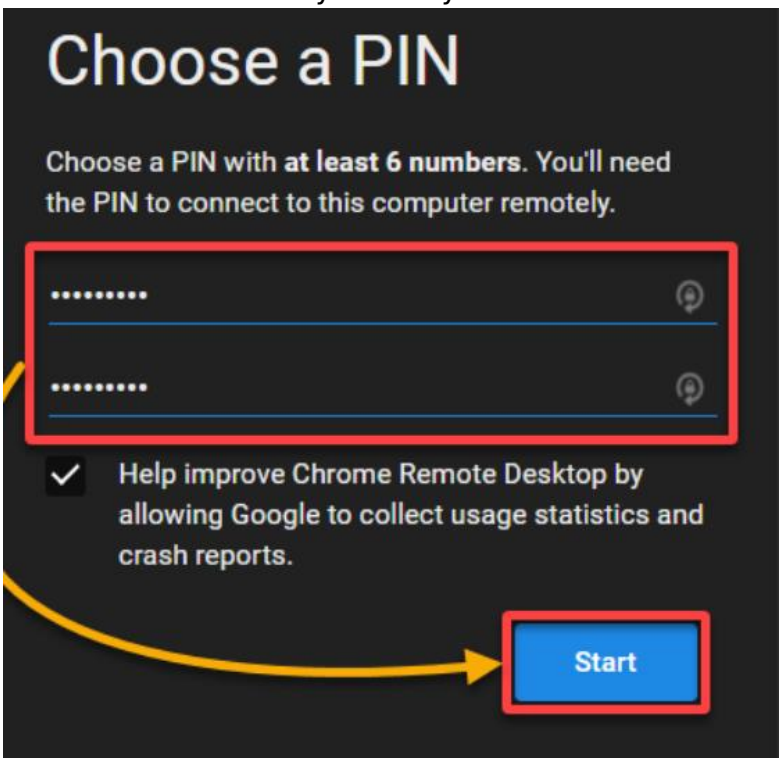

8. Once it's downloaded you should now see a Ready to install section, click the Accept & Install button

9. Now provide a descriptive name for your PC, this is what you and someone connecting to your PC will see, so you'll want it to easily identify the device (e.g. like a name and if you have multiple devices a designation : NAME-LT for a laptop, NAME-D for a desktop etc.

10. Next set a strong PIN number that will act like a password and will be required if you want to remotely access your PC.

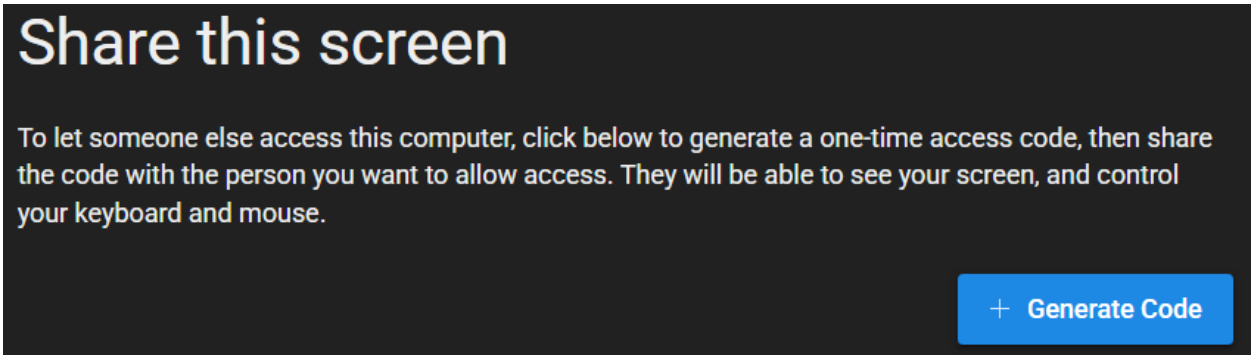

If successful you should now see your PC name

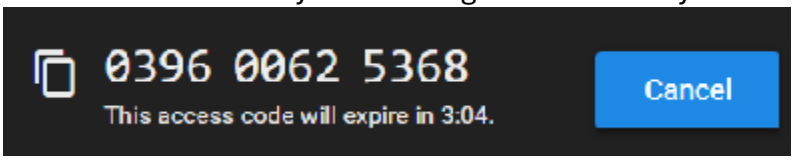

11. Setup is now complete. In order to now grant someone access switch to the Remote Support section

12. The circular blue download button underneath Share this screen should have changed and you should now see a **'+ Generate Code'** button. Click it

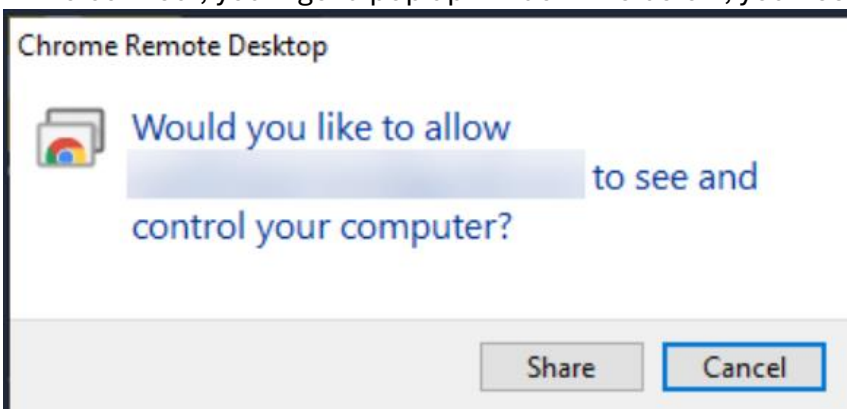

13. You'll then see a code number replace the Generate Code button. Send this code to whoever you want to grant access to your PC.

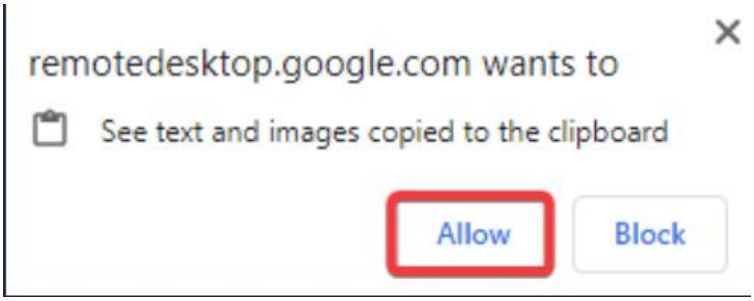

They'll need to receive and enter the code before the timer runs out, otherwise you'll need to generate a new code.

14. There's a couple more things you'' probably have to do, atleast the first time a person connects :

a. First you may have to ALLOW them access after they've entered the Code and attempt to connect, you'll get a pop up window like below, you need to click SHARE to allow it :

b. Then once the person connecting attempts to use the keyboard or mouse you'll get another popup that you'll need to click ALLOW on.

That should be it!
